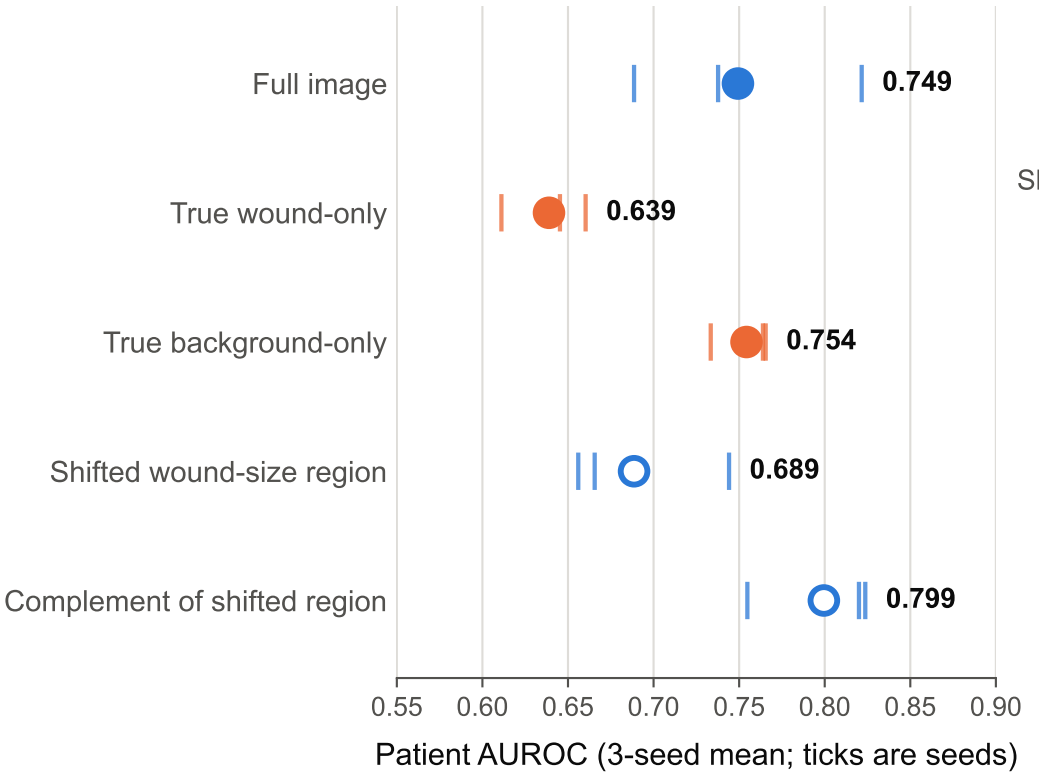
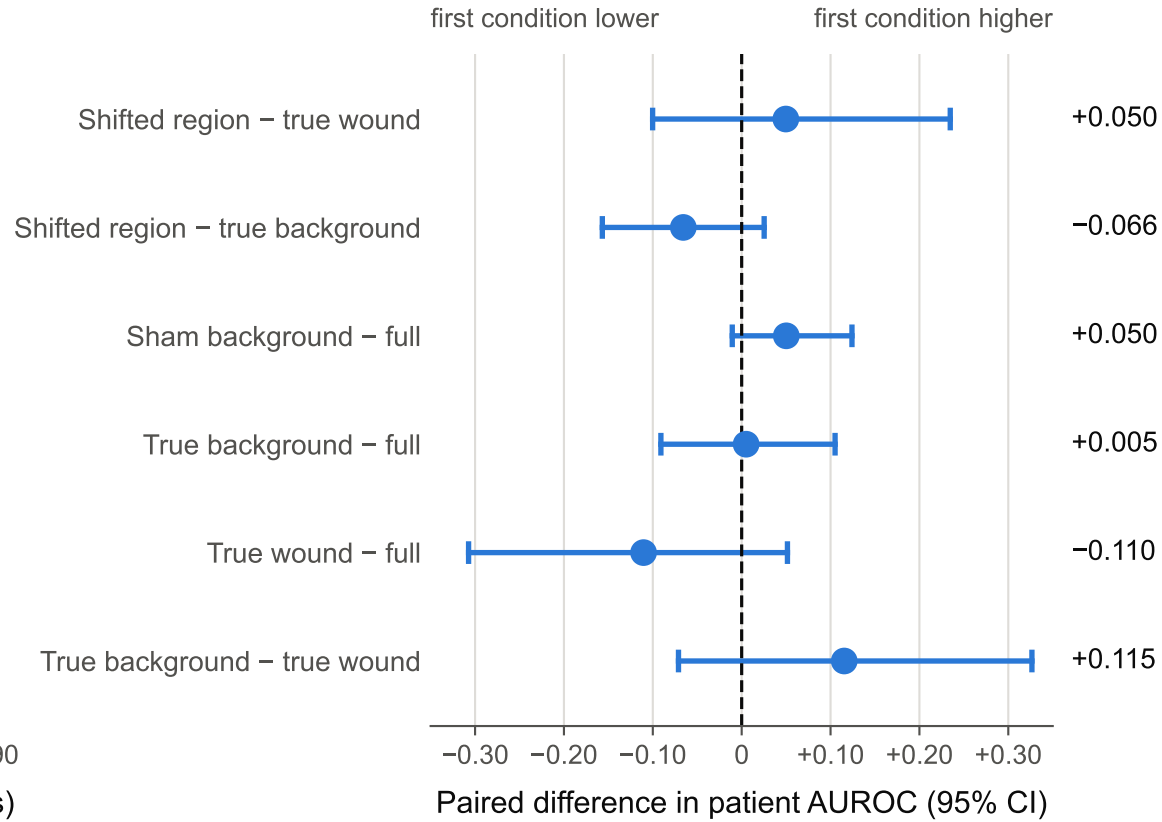
Spatial masking and sham controls

Patient-level AUROC; mask-eligible postoperative cohort (168 patients, 12 SSI events; 1,296 images)

A Absolute performance by retained region



B Paired AUROC differences



Open circles denote circularly shifted sham regions; 99.6% of images had intersection-over-union ≤0.05 with the true wound mask (maximum 0.109).

Each condition is a mean over three training seeds; intervals in B are paired patient-bootstrap estimates (20,000 resamples). No contrast is significant after Holm correction.
